

## My equations for orbit fitting

Determining observables from  
Orbital elements:

Orbital plane:

$t_0$  = time of periastron  
passage

$t$  = time of observation

$$n = \sqrt{\frac{\mu}{ma^3}} \leftarrow \text{mean motion -or- orbital angular frequency}$$

$$n \left[ \frac{1}{s} \right]$$

$$n = \frac{2\pi}{P}$$

$P$  = period

$$P = \sqrt{\frac{a^3}{\mu}}$$

Kepler's 3rd  
law  
 $a$  [AU]  
 $M$  [M<sub>☉</sub>]

$$M = n(t - t_0) \leftarrow$$

$= E - e \sin E$  mean  
anomaly

= fraction of orbit completed at  
time of observation expressed as  
an angle in radians  
if on a circular orbit  
of radius  $a$

$E$  = eccentric anomaly  
deviation from circular  
due to eccentricity

$$\left\{ \begin{array}{l} r \cos f = a(\cos E - e) \\ r \sin f = a\sqrt{1-e^2} \sin E \end{array} \right\}$$

Kepler's constant:

$$K = \frac{\mu}{m} \quad \text{where } \mu = Gm_1m_2 \quad \text{reduced mass}$$

$$\left[ \frac{m^3}{s^2} \right] \quad m = \frac{1}{m_1^{-1} + m_2^{-1}}$$

In the orbital plane:

$$X_0 = (r \cos f, r \sin f, 0)$$

$$= (a(\cos E - e), a\sqrt{1-e^2} \sin E, 0)$$

$$V_0 = \left( -\frac{na \sin E}{1 - e \cos E}, \frac{na\sqrt{1-e^2} \cos E}{1 - e \cos E}, 0 \right)$$

In the plane of the sky,  
perform 3 rotations:

$$X = R_z(\Omega) R_x(i) R_z(\omega) X_0$$

$$V = R_z(\Omega) R_x(i) R_z(\omega) V_0$$

$$\text{where } R_z = \begin{bmatrix} \cos \Theta & -\sin \Theta & 0 \\ \sin \Theta & \cos \Theta & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$R_x = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \cos \Theta & -\sin \Theta \\ 0 & \sin \Theta & \cos \Theta \end{bmatrix}$$

## accelerations

I wasn't able to get accel via rot matrices, but I derive them explicitly and got correct answers, so these eqns are correct. These derivations were not trivial.

$$\begin{aligned}\ddot{x} &= (\ddot{r} - r\dot{f}^2)(\cos\Omega\cos(\omega t + f) - \sin\Omega\sin(\omega t + f)\cos i \\ &\quad - (2\dot{r}\dot{f} + r\ddot{f})(\cos\Omega\sin(\omega t + f) + \sin\Omega\cos(\omega t + f)\cos i) \\ \ddot{y} &= (\ddot{r} - r\dot{f}^2)(\sin\Omega\cos(\omega t + f) + \cos\Omega\sin(\omega t + f)\cos i \\ &\quad + (2\dot{r}\dot{f} + r\ddot{f})(\sin\Omega\sin(\omega t + f) + \cos\Omega\cos(\omega t + f)\cos i) \\ \ddot{z} &= \left[ (\ddot{r} - r\dot{f}^2)\sin(\omega t + f) + (2\dot{r}\dot{f} + r\ddot{f})\cos(\omega t + f) \right] \sin i\end{aligned}$$

where

$$r = a(1 - e\cos E) \quad f = \Omega \arctan\left(\frac{\sqrt{1-e}\tan(\frac{E}{2})}{1+e}\right)$$

$$\dot{r} = \frac{ae n \sin f}{\sqrt{1-e^2}} \quad \dot{f} = \frac{n(1+e\cos f)}{1-e^2} \frac{\sin f}{\sin E}$$

$$\ddot{r} = ae \cos E \dot{E}^2 + ae \sin E \ddot{E}$$

$$\ddot{f} = \ddot{E} \frac{\sin f}{\sin E} - \dot{E}^2 \frac{e \sin f}{1 - e \cos E}$$

$$\dot{E} = \frac{n}{(1-e\cos E)} \quad \ddot{E} = -\frac{ne\sin f}{(1-e^2)} \dot{f}$$

/

Compute Keplerian  
elements from observables

$$h = \|\vec{r} \times \vec{v}\| \quad \text{where } \vec{r} = (x, y, z)$$

↑ specific angular momentum

$$\vec{v} = (v_x, v_y, v_z)$$

$$\hat{n} = \frac{\vec{r} \times \vec{v}}{h} \quad \begin{array}{l} \text{normal} \\ \text{vector to orbital plane} \end{array}$$

$$i = \cos^{-1}(\hat{n}_z)$$

$$\Omega = \arctan(\hat{n}_x, \hat{n}_y)$$

$$a = \left( \frac{z}{r} - \frac{v^2}{k} \right) \quad \text{where } r = \|\vec{r}\|$$

$$v = \|\vec{v}\|$$

$k = \text{Kepler's constant}$

$$k = \frac{\mu}{m} \left[ \frac{m^3}{s^2} \right]$$

parameter  $P = \frac{P_0^2}{\mu m}$

$$h = \frac{P_0}{m} \Rightarrow h^2 = \frac{P_0^2}{m^2} \left[ \frac{m}{\mu} \right] = \frac{P_0^2}{\mu m}$$

$\downarrow \quad \uparrow$   
 $K$

$$\Rightarrow P = \frac{h^2}{K}$$

$$e \sin f = \frac{P}{r} - 1$$

$$e \cos f = \frac{h \dot{r}}{K}$$

$$\dot{r} = \frac{(\vec{r} \cdot \vec{V})}{r}$$

$$e = \sqrt{e \sin^2 f + e \cos^2 f}$$

$$f = \tan^{-1} \left( \frac{e \sin f}{e \cos f} \right)$$

define  $U = \omega + f$

$$r \cos U = x \cos \Omega + y \sin \Omega$$

$$r \sin U = (-x \sin \Omega + y \cos \Omega) / \cos i$$

$$U = \tan^{-1} \left( \frac{r \sin U}{r \cos U} \right)$$

$$\omega = U - f$$

$$E = \arctan \left( \frac{\sqrt{1-e}}{\sqrt{1+e}} \tan \left( \frac{f}{2} \right) \right)$$

$$M = E - e \sin E$$

Done.

All of the above are a combination of Jack Wisdoms text and my own derivations.

Observationally:

$$\text{Decl} = +x$$

$$\text{RA} = +y$$

$$\text{Towards observer} = +z$$
